

Sealparts N70 o-ring size list
Listed by inside diameter

01.2

Introduction

The O-ring is the most common sealing device and is used in many different applications. The design is unique in its simplicity.

In this size list you will find one of the widest selections of o-rings on the market. New sizes are being added as tooling becomes available.

Detailed information about o-ring sizes, tolerances, and installation instructions can be found in national and international standards, e.g. SMS 1586 and ISO 3601. We will be pleased to inform you about them.

General information

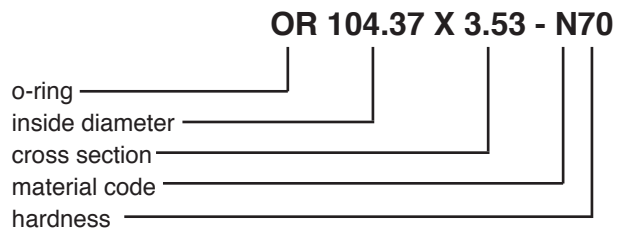

Sealparts information generally relates to o-rings used as dynamic seals in reciprocating applications and static seals with radial or axial squeeze.

The o-ring seals through its deformation between the surfaces against which it is supposed to seal. The working pressure at which the o-ring can be used is dependent on, the application, fitting clearance, the material, sealed medium and temperature. O-rings of a hard material generally provide an inferior sealing ability at low pressures due to permanent deformation.

Back-up rings should be used when the fitting clearance between the surfaces that the o-ring should seal is large enough to allow the o-ring to extrude at certain working pressures. In installations with standard dimensions and tolerances but with pressures exceeding 10 to 16MPa the o-ring normally must be installed with back-up ring(s).

Designations

SEALPARTS O-rings are designated according to a system that states the inside diameter, the cross section diameter, the material code and the hardness.
